

Mech Bay Instructions

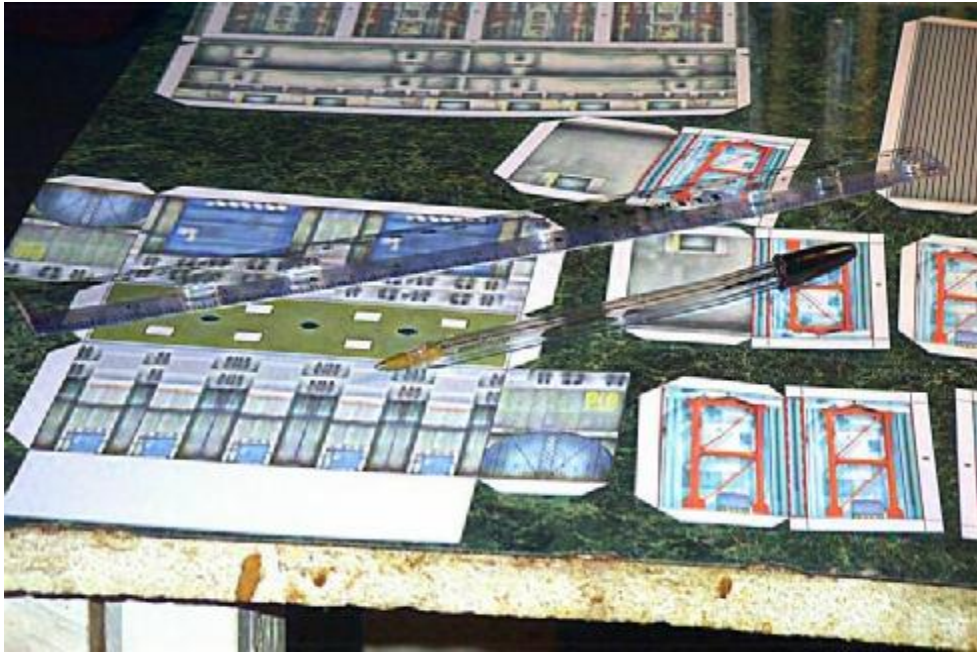

First cut out all pieces of the mech bay

Next using a straight edge and a scoring tool. Score the folding lines on all the pieces and the fold them but do not glue them together yet

I use a ruler and an empty ink pen

Third glue together all the diving walls
Make sure the little tabs are cut and folded inside walls before gluing
The tabs will make the wall look more sold. Do not glue
the roof and the back wall together yet.

Forth thing to do is to lay the back wall flat down and glue the dividing walls to the designated spaces. Make sure A & B have their outer surfaces face outward as seen in the picture

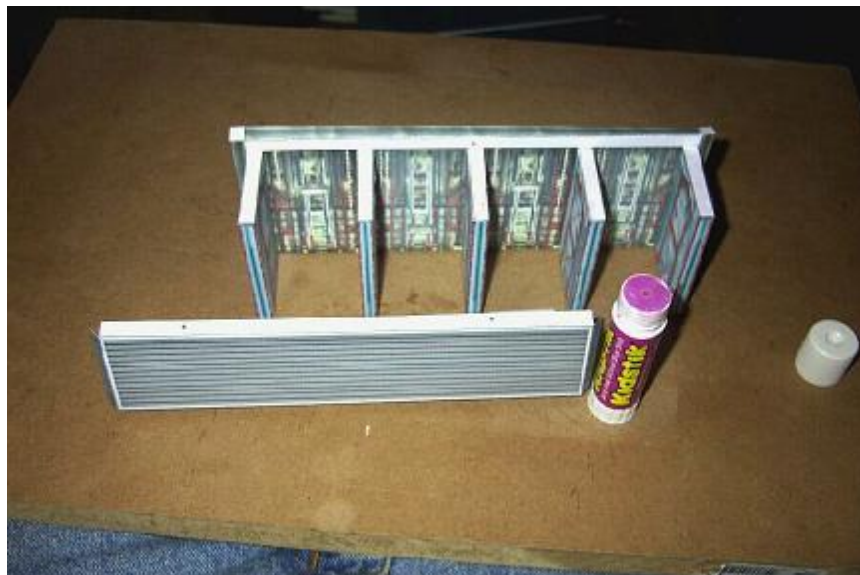

Fifth thing to do is apply glue to the tops of the dividing walls and to the back of the roof all along the entire surface of the tab where the arrows are.
are.

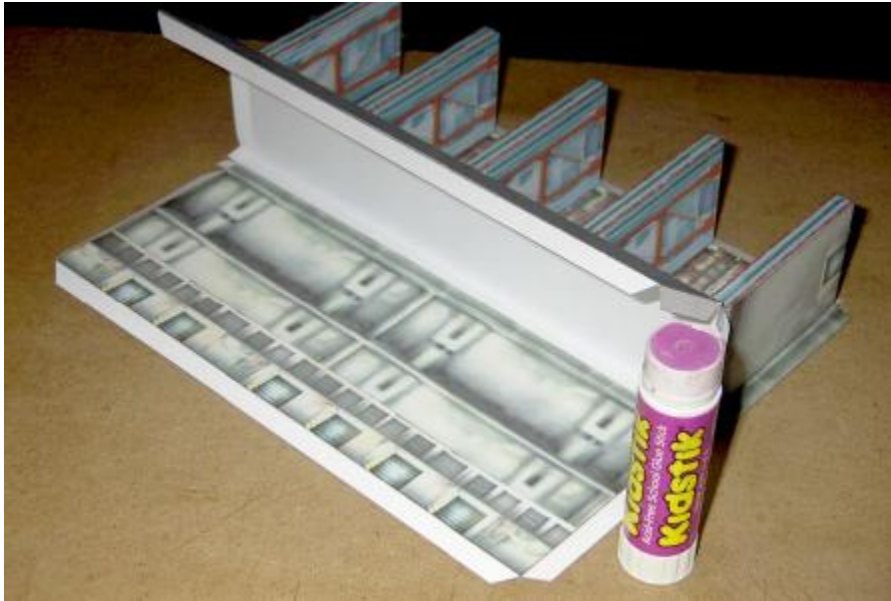

Make sure the arrows are facing up.

Now put the roof on top of the dividing walls and against the back wall.
You may have to press firmly to get the pieces to fit in place.
Also make sure the dividing walls are strait.

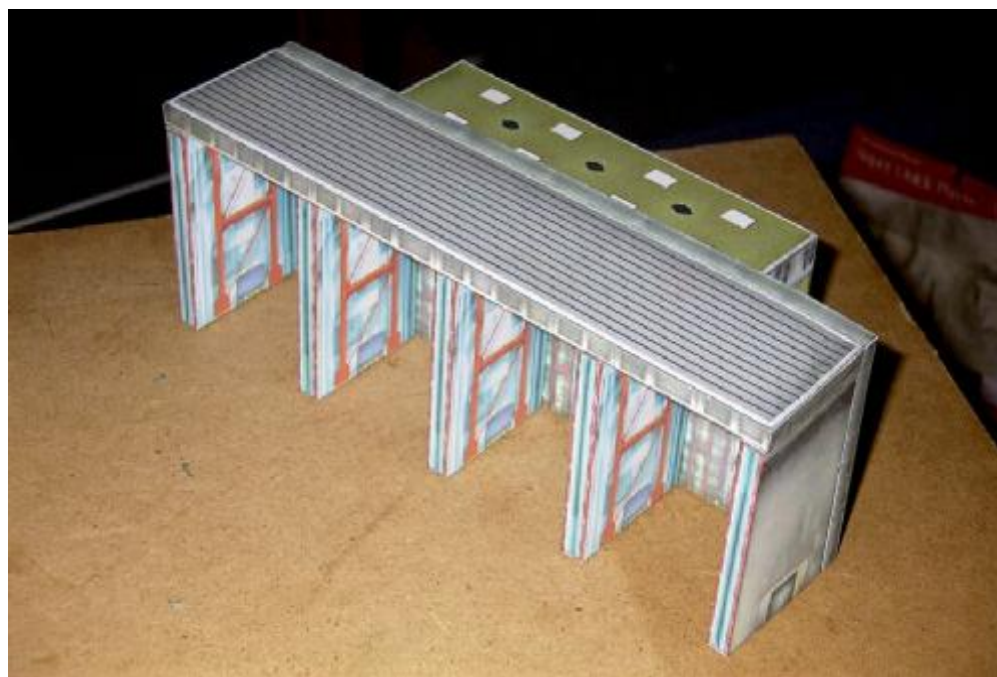

Now you are ready to fold and glue the roof and the back wall together
Start with the roof and then move to the back wall.

Lastly glue the storage building together. If you want you can glue it to the rest of the mech bay. I just leave it as separate build so I can use it as a separate building.

With all that out of your way your mech bay should look like this.

I hope this help

Terry
